	Revision: rev (01)	Date: January 29th, 2016
	☑ Draft	☐ Final
	Signature:	

1. Introduction

The CPTu sounding was performed as a part of the further geotechnical investigations recommended, in a manner to improve the findings (valley floor soil deposits) of the geotechnical investigations previously conducted.

The works have been executed by ASSACO.

The number of CPTu soundings needed and their final depths/locations were determined on site during the field works.

No CPTu sounding was performed within the Orange Garden (commercial) shown on PLAN G-01-CPTu (**Attachment 1**), due to the trees very close to each other.

2. CPTu Sounding

The field works were performed between October 08 and December 12, 2015 with extended work shifts of 12 hours or more per day. Thirty (30) soundings (**1,589m in total with 30 dissipation tests**), to a maximum depth of **76.5m** (CPTuVR6) were performed at locations shown on PLAN G-01-CPTu (**Attachment 1**) and **Photo 1.**

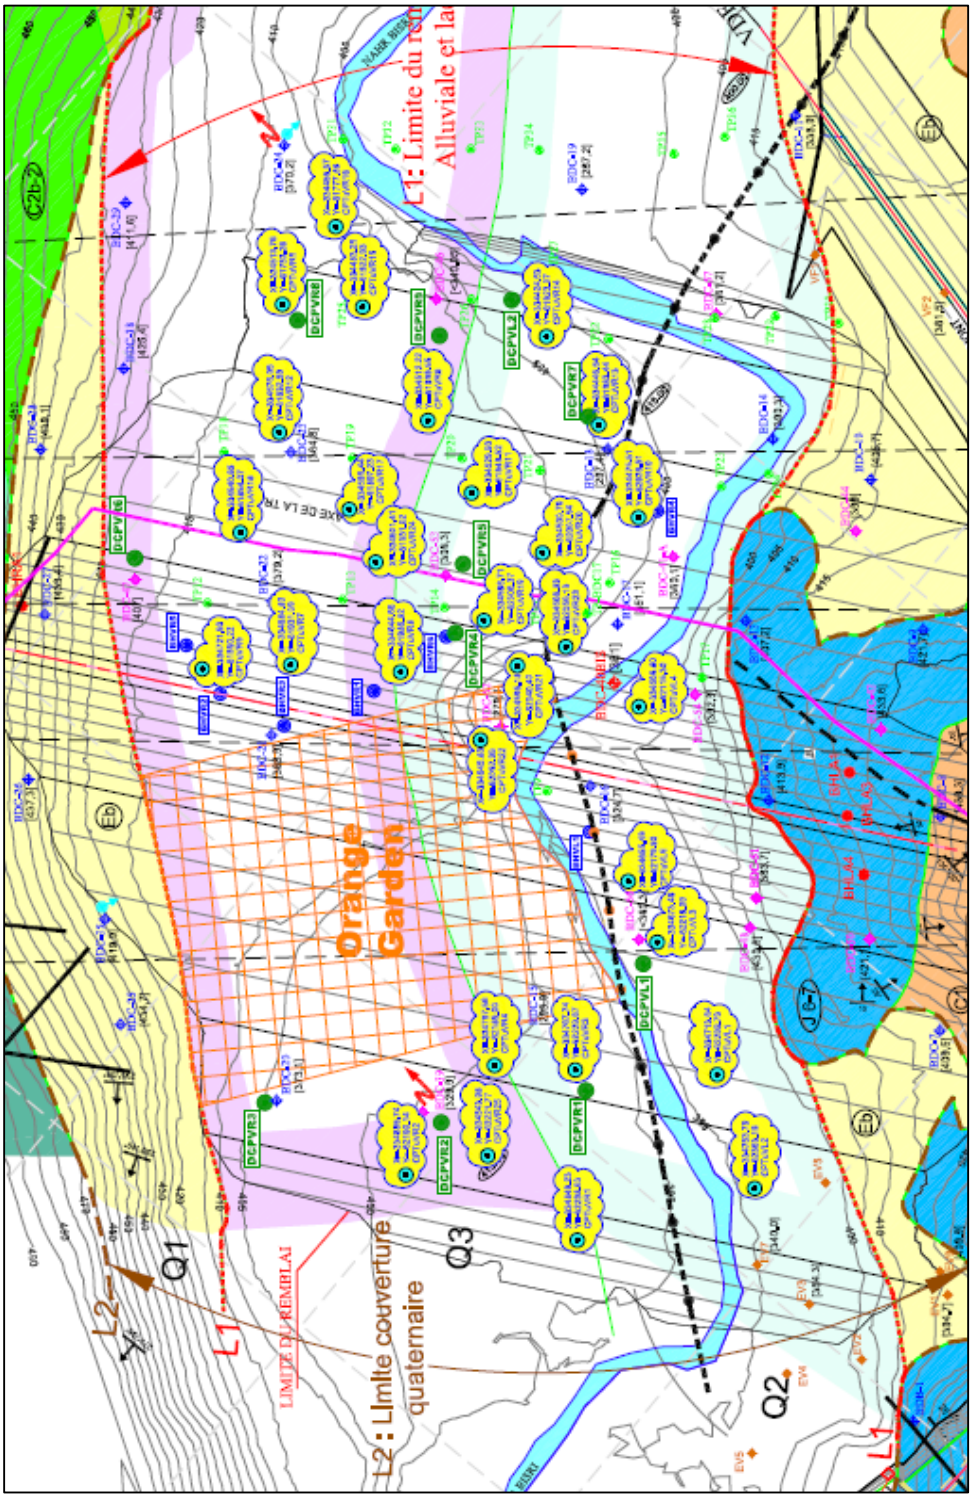

Photo 1: CPTu sounding locations

The CPTu sounding (piezocone penetration test with porewater pressure measurements and dissipation tests) to a depth of reaching the bedrock or refusal cone resistance (30 to 50MPa depending on depth of penetration) and/or safe trust (friction on pushrods after withdrawing and re-pushing , 145kN at a rate of penetration of 0.5 to 1cm/sec) with sustainable rebound of pushrods (3 to 4cm), were performed within the dam footprint area (valley floor active river, floodplain and lacustrine soil deposits overlying the bedrock).

*Some of the CPTu soundings were performed close to boreholes previously executed (see **Table 1**) at locations shown on PLAN G-01-CPTu (**Attachment 1**), in a manner to compare the results.*

CPTuVR25	-334844.0	-62221.8	397.8	58.0	Safe trust after withdrawing and re-pushing.	1 test at 50m

Five (5) CPTu soundings (**211m in total with 3 dissipation tests, Table 3**), to a maximum depth of **55 meters** were performed within the left side of the valley floor.

Table 3:

CPTu Sounding	Coordinates			Depth of sounding (m)	Remarks	Dissipation Test
	X	Y	Z			
CPTuVL1	-334713.6	-62299.8	396.3	26.0	Refusal cone resistance.	
CPTuVL2	-334753.8	-62363.2	396.1	46.0	Refusal cone resistance.	1 test at 35m.
CPTuVL3	-334673.5	-62218.1	396.3	54.0	Refusal cone resistance with relatively high trust.	
CPTuVL4	-334566.8	-62115.3	396.9	30.0	Bedrock.	
CPTuVL5	-334655.5	-62179.8	396.2	55.0	Safe trust after withdrawing and re-pushing.	2 tests at 20m and 40m

3. Scope of Works

The scope of works of this field investigation consisted of the followings:

- Mobilization/Demobilization including site and CPTu soundings setups.
- Access roads, work platforms, topographical surveys, water supply for pre-boring.
- Pre-boring.
- Piezocone penetration test with porewater pressure measurements (CPTu).
- Withdrawing and re-pushing.
- Dissipation test.
- CPTu interpretations (GEOMIL CPTask processing software).

Access rods as shown on **Photo 2 to 4** were constructed within the right and left side valley floor of the dam footprint, to reach the locations of the soundings preassigned alongside the bed of the river (river bank). Crawler mounted hydraulic backhoe excavator was used in access road construction.

Photo 2: Access roads reaching the right side valley floor

Photo 3: Access roads reaching the right side river bank

Photo 4: Access roads reaching the left side river bank

In coarse grained (active river) soil deposits with maximum particle sizes that approach or exceed the diameter of the cone (refusal cone resistance of 50MPa); pre-boring (down-hole technique) with casing (OD: 74.4mm and ID: 67.5mm), was applied to prevent damage to piezocone. Even so, CPTu rig was occasionally relocated to avoid obstructions encountered.

The depths of disturbances due to the pre-boring were taken into account during the soundings.

A crawler mounted rotary drill rig (CMV MK 900 D) as shown on **Photo 5** was standby during the soundings and used in pre-boring. The destructive drilling (wash boring) was performed by using $2^{3/8}$ inches (60.3mm) diameter tricone rock bit with BW (OD: 54mm) drill rods.

Photo 5: Pre-boring

In static cone penetration test with porewater pressure measurements, GEOMIL cones with electrical sensors (design Type 2 piezocones with refusal cone resistance of 50MPa, see **Photo 6 and 7**) and at 15cm^2 (more robust, to improve the depth of penetration) and 10cm^2, on the end of a series of lubricated (to minimize the rod friction for deeper sounding) push roads (GEOMIL thick-walled tubes in 1m lengths, see **Photo 8**), were driven into the subsurface soil stratums at a standard rate of penetration of 2cm (plus and minus 0.5cm) per second.

Penetration rates less than the "standard" (less than 0.5cm/sec) were used in soil stratums contain medium and coarse gravels, to prevent damage to piezocone and to reduce the drift.

Photo 6: 15cm^2 piezocone (GEOMIL)

Photo 7: 10cm^2 piezocone with friction reducer (GEOMIL)

Photo 8: Push rod and electrical cable prestrung through the rod (GEOMIL)

The less penetration rates (0.5 to 1cm/sec) were also used in deep sounding (deeper than 50 to 65m, depending on trust reached) to avoid push rod bending (see **Photo 9**) and breakage due to excessive trust (friction along the push rods), such as the one occurred in CPTuVR6; pushrods were bended and broken under excessive trust of 165kN, string of pushrods (59m long in total) and piezocone (15cm^2) were lost down the hole.

According to GEOMIL CPTask (logs of soundings); in saturated clays – clay to silty clay and clayey silt, effect of less penetration rates on cone resistance was found negligible.

Photo 9: Push rod bending (CPTuVR22)

In deep soundings, friction along the pushrods was reduced by withdrawing (and re-pushing) the piezocone and string of rods up to one third to one half of the penetration depth at which the safe trust caused stopping, to improve the depth of sounding. In addition to that, the friction reducers as shown on **Photo 7** that increase push rod outside diameter by approximately 25%, were used for 10cm^2 cone.

A truck mounted (reaction frame of 25 tons, see **Photo 10 to 15**) GEOMIL trust mechanism (pushing force >= 200kN and pulling force >=150kN, see **Photo 16**) with GEOMIL piezocone data acquisition system (see **Photo 17**) were used in static piezocone penetration test.

Photo 10: CPTuVR15 and CPTuVL5

Photo 11: CPTuVR14 and CPTuVR11

Photo 12: CPTuVR21 and CPTuVR16

Photo 13: CPTuVR13 and CPTuVR6

Photo 14: CPTuVL3 and CPTuVR12

Photo 15: CPTuVR4 and CPTuVR25

Photo 16: Truck mounted GEOMIL trust mechanism

Photo 17: GEOMIL Piezocone data acquisition system

The truck mounted trust mechanism was set up by using hydraulic rams to obtain a trust direction as near as possible to vertical (see **Photo 18**).

Photo 18: Setting up the truck mounted trust mechanism by using hydraulic rams

A tubular rod guide (see **Photo 19**) was used at the base of the trust mechanism to prevent push rod bending.

Photo 19: Tubular rod guide

The non-verticality of the sounding (drift) was continuously measured with slope sensors to avoid bending the push rods and obtaining unreliable penetration resistance data.

The fine porous filter (deaired filter element) made from bronze was placed at the shoulder (both 10cm^2 and 15cm^2, between cone and friction sleeve) to allow correction of tip resistance (design Type 2, see **Photo 20**).

Photo 20: Design Type 2 configuration

The filter was deaired in silicone oil bath under vacuum of -90kPa for 24 hours (see **Photo 21**) and stored submerged in the oil until ready for assembly.

Photo 21: Deaeration of the filter element

Prior to each sounding, the piezo-elements with all fluid chambers were assembled and confined areas were flushed with fluid (saturation) as shown on **Photo 22**, submerged in silicone oil to remove the air bubbles (saturation of the piezocone) and the assembled system was enclosed with fluid-filled condom (see **Photo 23**).

Photo 22: System saturation

Photo 23: Enclosing the assembled system

The measured (continuously) analogue data (cone resistance, sleeve friction, friction ratio and dynamic porewater pressure) was converted to the digital form at 10mm intervals (see **Photo 24**). The plots/logs of soundings and accompanying tabular data are presented in **Appendix 2** of this report.

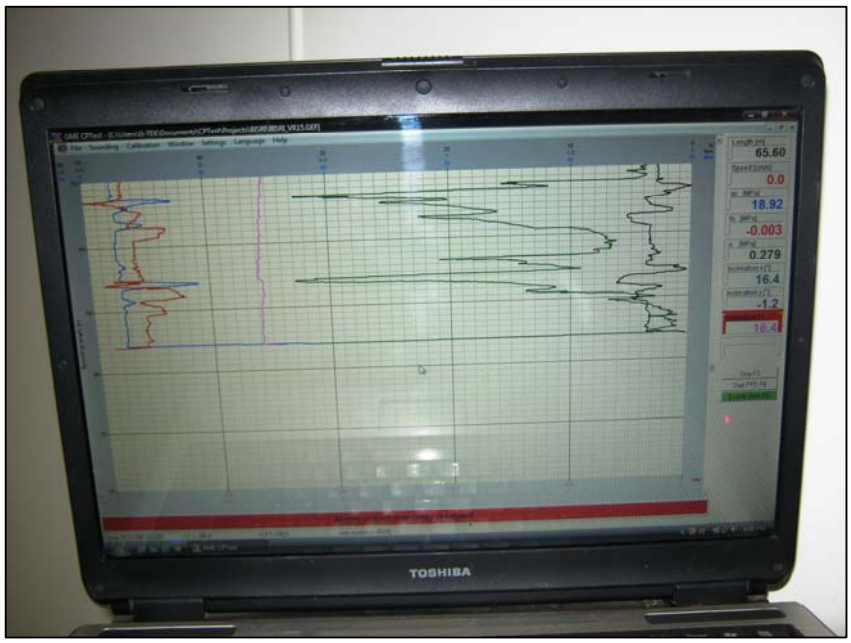

Photo 24: Data recording

Zero load readings of all sensors (reference measurements) were recorded at the start and end of each CPTu sounding with penetrometer tip hanging freely in air or in water (see **Photo 25**). Calibrations were carried out at regular intervals based on the stability of the zero load readings with functional checks during the field works.

Photo 25: Zero load readings

Thirty (30) dissipation tests in total (refer to **Table 2a to 2d** and **Table 3**) after releasing the fore on pushrods were conducted in saturated clays – clay to silty clay and clayey silt at different depths and soundings, until half the initial excess porewater pressure (peak value measured at U_2 location) has dissipated (90 minutes to 150 minutes depending on type and permeability of soil tested).

Where the time required for 50% dissipation turned out to be excessive (more than 150 minutes), the test was terminated prior to reaching the 50% level, due to friction-buildup on string of pushrods (5kN to 10kN per dissipation test depending on depth of sounding and test duration).

The dissipation test was performed to obtain a better estimate of the coefficient of consolidation and reported as a record of porewater pressure versus logarithm of time (see **Photo 26**). The dissipation curves are presented in **Appendix 2** of this report.

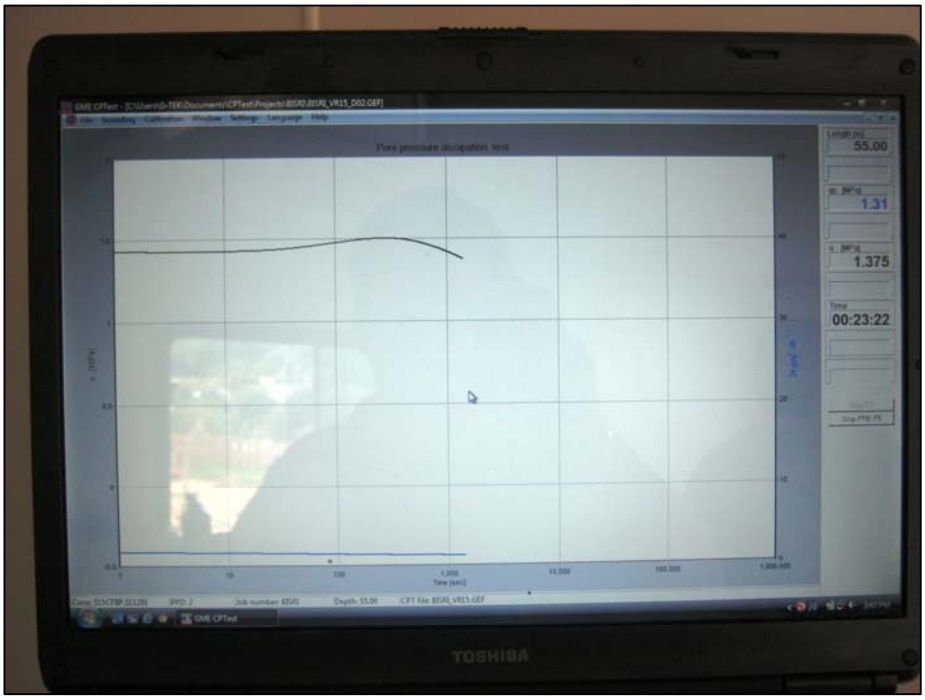

Photo 26: Dissipation test with initial rise in porewater pressure before beginning to dissipate (CPTuVR15 at 55m).

Semi-empirical correlations were used to estimate the following geo-mechanical parameters from the CPTu sounding, GEOMIL CPTask Processing Software was used in interpretations.

- Soil profile type.
- Equivalent SPT N_{60} profile.
- Soil unit weight.
- Undrained shear strength.
- Soil sensitivity.
- Overconsolidation ratio.
- Internal friction angle.

- Relative density.
- Stiffness and modulus.
- Hydraulic conductivity (permeability).
- Coefficient of consolidation.
- Constrained modulus.

4. Closure

The findings presented in this factual report are based on the assumption that the subsurface soil stratums and their conditions do not deviate appreciably from those disclosed in soundings. There may be conditions pertaining to the site which were not disclosed by this subsurface soil survey, and thus could not be taken into account. Therefore, the findings are valid under this assumption only.
